Project 3: Experience Working With AI

Paris: I used AI for a few different aspects of this project. One of the main areas I used it in was for a lot of the formulas. For example, I was unsure of the proper syntax to calculate the page number, offset, and physical addresses. I also used it for the FIFO TLB update, as I was unsure of how to make the index wrap around to the beginning after reaching the end. I also used AI to figure out the code to read BACKING_STORE.bin from disk and then into memory, as I had very little experience with seek and read, as suggested by the instructions. I used AI to aid me in implementing the FIFO page replacement in main2.c. I based the code on the in-class lab; however, I was a little unsure of how to implement this code into our program, so I used AI to understand the concepts and how I needed to slot them into the program. Overall, much like the other projects, I found AI very useful, as it could give quick, simple, and tailored explanations and help that were easier to understand and saved time compared to doing research online and reading man pages. I did not encounter any significant problems with AI beyond simple hallucinations or prompt misunderstanding.

Anthony: I used AI. However, I did not end up using AI as much as I did in the last project. I think overall that while this project was not easy I think the last project had a much more demanding knowledge starting point in comparison to this one. The biggest things were some sanity checks throughout my code and most importantly since I'm not super familiar with python it helped me out a ton getting something working, even if it was quite similar in structure to the last script we used. Also some refreshing on the logic of these page replacement algorithms and general foundational learning on the subject was good. Overall, it was a good experience.
